Non-Sexually Transmitted Pyosalpinx in an Adolescent

Eman Bahaa, MD, MSc, MBBCh BAO* Noor Hashim Al-Sayed, MBBCh BAO**

Pyosalpinx is a condition most commonly seen in sexually active adult females; it could lead to severe fertility complications. However, this condition is very rare during childhood and in non-sexually active females.

We present a rare case of a sixteen-year-old non-sexually active female with Pyosalpinx. The patient had a history of abdomino-pelvic reconstruction surgery for congenital genital anomalies. The disease was treated with salpingectomy and adnexal debridement.
