

Medical Quiz

Moh'd Khalid, MD* Neelam Malik, MD, MNAMS**
Hakima Al Hashmi, FRCR, FFR (RCSI)***

A six weeks-old healthy child with history of swelling in the right side of neck with ipsilateral neck tilt of one week duration was referred for an ultrasound (U/S) examination of neck. There was no history of birth trauma or any complication during delivery and his blood parameters were within normal range. U/S examination of neck revealed an ovoid soft tissue mass of homogenous echotexture (Figure-1).
